PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
U.S. Patent and Trademark Office
P.O. Box 2327
Arlington, VA 22202

ATTENTION: Box New Patent Application

Sir

Prior to calculating the fee due for the above-identified application and prior to the first Office Action, please amend the above-identified application, as follows:

In the claims

Please amend claims 3, 4, 6, and 8-12, to place the claims in more suitable form for US prosecution.

In the claims

3. (Amended) A sensing apparatus according to claim 1, wherein the sensing apparatus further comprises an actuatable port means, openable to release the separable elements.
4. (Amended) A sensing apparatus according to claim 1, wherein the separable elements each comprise a rigid casing with a sealable aperture, the casing surrounding data storage means in which the acquired data is stored for transfer to the surface.
6. (Amended) A sensing apparatus according to claim 1, wherein the separable elements are spherical.
8. (Amended) A sensing apparatus according to claim 1, wherein the housing of the sensing apparatus and casings of the separable elements are formed from plastics material or metal.
9. (Amended) A sensing apparatus according to claim 1, wherein the separable elements are configured to be either neutrally buoyant or buoyant, in relation to well fluids.
10. (Amended) A sensing apparatus according to claim 1, wherein the separable elements have a diameter in the range of 1 to 10cm.
11. (Amended) A sensing apparatus according to claim 1, wherein the separable elements have a diameter in the range 1 to 5cm.
12. (Amended) A sensing apparatus according to claim 1, wherein the data is encrypted prior to transfer to the separable elements.

REMARKS

The above amendments do not add any new matter and do not address issues related to patentability. Rather the amendments are made to place the claims in more suitable form for US prosecution. Favorable consideration of this application is requested. Please do not hesitate to contact the undersigned by phone for prompt resolution of any outstanding issues. It is believed that no fee is due for this Preliminary Amendment, however, if such a fee is due, the Commissioner is authorized to charge such fee, or credit overpayment, to Deposit Account No. 19-0615.

Respectfully submitted,

WBS

In the claims

3. (Amended) A sensing apparatus according to claim 1 [or claim 2], wherein the sensing apparatus further comprises an actuatable port means, openable to release the separable elements.
4. (Amended) A sensing apparatus according to [any of the preceding claims] claim 1, wherein the separable elements each comprise a rigid casing with a sealable aperture, the casing surrounding data storage means in which the acquired data is stored for transfer to the surface.
6. (Amended) A sensing apparatus according to [any of the preceding claims] claim 1, wherein the separable elements are spherical.
8. (Amended) A sensing apparatus according to [any of the preceding claims] claim 1, wherein the housing of the sensing apparatus and casings of the separable elements are formed from plastics material or metal.
9. (Amended) A sensing apparatus according to [any of the preceding claims] claim 1, wherein the separable elements are configured to be either neutrally buoyant or buoyant, in relation to well fluids.
10. (Amended) A sensing apparatus according to [any of the preceding claims] claim 1, wherein the separable elements have a diameter in the range of 1 to 10cm.
11. (Amended) A sensing apparatus according to [any of the claims 1 to 9] claim 1, wherein the separable elements have a diameter in the range 1 to 5cm.
12. (Amended) A sensing apparatus according to [any of the claims 1 to 11] claim 1, wherein the data is encrypted prior to transfer to the separable elements.

Downhole Sensing Apparatus With Separable Elements

FIELD OF THE INVENTION:

The invention relates to a sensing apparatus
5 particularly suitable for use downhole within oil and
gas wells.

BACKGROUND OF THE INVENTION:

Gathering of information relating to a well
10 is possible by lowering a logging tool on a wireline
into a well. The logging tool acquires data relating
to the well characteristics, such as fluid velocity and
temperature, and typically transmits the logged data to
surface by telemetry along the wireline. However
15 logging tools on wirelines often get caught within the
well, leading to problems of acquiring data at desired
positions and also retrieval of the tool.

Self-powered robotic logging devices have
20 been developed to avoid the need for use of a wireline.
It is relatively easy to get a self-powered robotic
device to the bottom of a well because downwards travel
of the device involves moving from smaller diameter
production tubing to larger diameters at the bottom of
25 the well. However difficulties occur in retrieving
such devices because the return journey to the surface
involves locating, and passage through, the smaller
diameter opening.

30 It is one aim of the present invention to
provide a sensing apparatus which at least in part

WO 01/04661

PCT/GB00/02697

overcomes the existing difficulties with robotic logging devices.

5 SUMMARY OF THE INVENTION:

In accordance with one aspect of the invention, there is provided sensing apparatus comprising a housing and sensing means, characterised
10 in that the housing contains a plurality of separable elements to which data acquired by the sensing means is transferred, and which are releasable, after data transfer, from the housing.

15 The separable elements act as passive receptors for data acquired from the sensing means, and in this way, an autonomously powered device can be sent downhole and left in place while data is transferred to the surface over time by sending the separable elements
20 back to the surface, so extending the useful lifetime of the sensing apparatus.

The sensing means may include or be connected to electronic memory means which temporarily stores the
25 acquired data. The stored data can be downloaded to a further memory device in a separable element when required.

Preferably the sensing apparatus comprises
30 actuatable port means, openable to release the separable elements.

Preferably the separable elements each
comprise a rigid casing, with a sealable aperture, the
casing surrounding data storage means, such as a memory
5 chip, in which the acquired data is stored for transfer
to the surface. The aperture allows a connection to be
made to the data storage means therein so that data can
be written thereto. Closure and sealing of the
aperture permits watertight sealing of the element to
10 protect the memory chip from wellbore fluids once the
separable element is released.

Preferably the aperture is surrounded by a
sealing material, typically made of thermosetting
15 plastics material, which can be heat treated within the
housing so as to provide a fluid-tight seal which is
continuous with the casing surface. This improves the
robustness of the separable element.

20 The separable elements are preferably
spherical so as to reduce the likelihood that they will
snag on protrusions within the interior of the well.
Thus typically each separable element will comprise two
hollow metal hemi-spheres, joined by a plastics seal to
25 form a sphere.

Preferably the separable elements are also
configured to be either neutrally buoyant, or buoyant,
in relation to well fluids, so that they are easily
30 carried to surface.

WO 01/04661

PCT/GB00/02697

sensing and data storage components which are contained within the device 16, and the wall 40 is generally provided with a number of individual compartments so that different parts of the middle section 30 can be
5 sealed with respect to other compartments.

Towards the rear end of the middle section 30, a motor 42 is provided which is attached to the propeller 36 carried on the second cone 34. The motor
10 42 and other electrical components within the device are powered by three batteries 44 arranged in series, and the motor 42 turns the propeller 36 to drive the device 16 downhole. Where the motor 42 and propeller 36 are attached, shaft seals 46 are used to ensure that
15 the rear end of the middle section is sealed against external fluid.

A ballast holder 50 is placed centrally of the middle section 30, and an appropriate amount of
20 ballast introduced into this container so that the tool 16 is neutrally buoyant, i.e. it neither sinks nor rises within the fluid downhole. This ensures that the tool 16 can be powered through the produced fluids by the motor 42 and associated propeller 36. A variety of
25 sensors 52, 54, 56, 58 are included within the body of the device 16 to sense various parameters downhole including pressure, temperature, flow rate, chemical species, magnetic flux and fluid composition. The data provided by the sensors 52, 54, 56, 58 is stored in
30 data acquisition and control board 62 which, like the motor 42, is powered by the three batteries 44.

Towards the front end of the middle section, a large number of releasable elements 64, or memory fish, are contained in a front compartment 68 which is sealed from the remainder of the device. The compartment need not be sealed hermetically. The releasable elements 64 are carried on and detachably connected to a bus 66 which is in electrical communication with the data acquisition and control board 62. The front compartment 68 is provided with a flap 70 in its external wall, which whilst normally closed, opens to allow release of selected fish in response to a command from the control board 62. The control board 62 is pre-programmed at surface before the device 16 goes downhole with a program which instructs release of the elements 64 in a chosen manner, typically to release a small number of fish at spaced apart intervals of time over a few years.

Each fish 64 comprises a hollow sphere 72 of around 3 to 5cm diameter made substantially of metal and which encases a memory chip 74 to which data can be downloaded via bus 66 from the data acquisition and control board 62. The sphere 72 has an aperture 76 surrounded by heat-sealable material, such as thermosetting plastics material, so that the fish is a completely sealed device. Electrodes 80 on the bus 66 communicate with the memory chip 74 of each fish 64 either inductively or by any other indirect means such as infra-red, or by direct contact through electrical pin conductors attached to the electrodes 80 protruding

WO 01/04661

PCT/GB00/02697

into the sphere through the aperture as shown in Figure 3 so as to establish an electrical connection with the chip. Additionally, the data can be encrypted prior to being transferred to the fish. For example, the encryption could be carried out on data acquisition and control board 62, and the encrypted data could be transmitted to memory chips 74 as described.

When a fish is ready for release, it is mechanically raised from the location where it mates with the electrodes 80 so as to separate it from the electrodes on the bus. The opening where the electrodes connected with the chip is sealed by use of a heating element on the sealable material so as to form a substantially smooth water-tight sphere, and then the fish is released. The smooth sealed sphere is robust and resistant to ingress of fluid.

The fish 64 are essentially chips embedded in low density plastics material and can be as small as 1cm², or less, and larger if necessary.

The robotic device 16 can carry up to hundreds of small memory fish 64, which are either neutrally buoyant or partially buoyant and after each set of measurements instructed via the control board 62, the board downloads the collected data to a chosen number of fish 64, and then instructs separation of the selected fish from the bus 66, sealing of the spheres 74 ready for release, and then opening of flap 70 to release the spheres 74. The fish released into the

WO 01/04661

PCT/GB00/02697

fluid flowing in the well are swept upwards and are then retrieved at surface. Retrieval of the fish at surface can be assisted by selecting the size and shape of the plastics body 72 of the fish. Typically the
5 same data is written to more than one fish so that the chances of retrieval of the data are maximised. If the data in the fish had been encrypted, the data will then be decrypted after retrieval.

10 Before release of the memory fish 64 into the flow, the tool 16 is programmed to send an acoustic signal by using a transducer, the acoustic signal travelling to surface either via the fluid or the tubulars, so as to alert crew at surface that the
15 release is about to take place and that steps should be taken to retrieve the memory fish. Alternatively the fish may be released at a pre-determined time.

By using the memory fish 64, a robotic
20 production logging device which has been sent to the bottom of a well can lie within the well over a period of time whilst still providing measurements that can be sent to surface via the fish. By providing a large number of memory fish, typically 300-500, within the
25 sensing apparatus and releasing these at selected intervals, the well can be monitored over, for example, 3 to 5 years.

With a robotic logging device, it is much
30 easier to send the device to the bottom of a well than it is to get it to travel back to surface. This is

largely because of the geometry of the tubulars used to encase the internal wall of the well structure as when the robotic device travels from position A to position C, for example, the device moves from smaller diameter
5 tubes of the production tubing to larger tubes of the completion. For the robotic device to travel back to surface, it must travel from a larger diameter tube into a smaller opening, which involves difficulties with locating and entering the smaller tubing. The
10 present invention allows the logging device to remain downhole, whilst still permitting logged data to reach the surface by using the small passive data receptors to carry data to surface by being carried up within the fluid to the surface.

15

The tool can thus sample the well over depth and over periods of time to provide information about the evolution of the downhole flow and fluid character, both of a chemical and physical nature. The device
20 provides a simple production logging tool which avoids well intervention and ensures that wells can be logged cheaply when a convention approach would be too costly.

The sensing apparatus does not necessarily
25 need to be an autonomously powered device, but could be provided either on wireline or even within the casing used to complete the well.

While preferred embodiments of the invention
30 have been described, the descriptions are merely illustrative and are not intended to limit the present invention.

CLAIMS

What is claimed is:

- 5 1. A sensing apparatus comprising a housing
and sensing means, characterised in that the housing
comprises a plurality of separable elements to which
data acquired by the sensing means is transferred, and
which are releasable, after data transfer, from the
10 housing.
2. A sensing apparatus according to claim 1,
wherein the sensing means includes or is connected to
electronic memory means which temporarily stores the
15 acquired data.
3. A sensing apparatus according to claim 1
or claim 2, wherein the sensing apparatus further
comprises an actuatable port means, openable to release
20 the separable elements.
4. A sensing apparatus according to any of
the preceding claims, wherein the separable elements
each comprise a rigid casing with a sealable aperture,
25 the casing surrounding data storage means in which the
acquired data is stored for transfer to the surface.
5. A sensing apparatus according to claim 4,
wherein the sealable aperture is formed by an aperture
30 surrounded by a sealing material, with the sealing
material being heat treatable within the housing so as

to provide a fluid-tight seal which is continuous with the casing surface.

6. A sensing apparatus according to any of the preceding claims, wherein the separable elements are spherical.

7. A sensing apparatus according to claim 6, wherein each separable element comprises two hollow metal hemi-spheres, joined by a plastics seal to form a sphere.

8. A sensing apparatus according to any of the preceding claims, wherein the housing of the sensing apparatus and casings of the separable elements are formed from plastics material or metal.

9. A sensing apparatus according to any of the preceding claims, wherein the separable elements are configured to be either neutrally buoyant or buoyant, in relation to well fluids.

10. A sensing apparatus according to any of the preceding claims, wherein the separable elements have a diameter in the range of 1 to 10cm.

11. A sensing apparatus according to any of the claims 1 to 9, wherein the separable elements have a diameter in the range 1 to 5cm.

30

WO 01/04661

PCT/GB00/02697

12. A sensing apparatus according to any of the claims 1 to 11, wherein the data is encrypted prior to transfer to the separable elements.

5 13. A method of acquiring data from downhole, comprising placing downhole a sensing apparatus containing a number of separable elements and releasing the elements to carry acquired data to the surface as required.

10

14. Apparatus and method substantially as herein described with reference to, and as illustrated in, the accompanying drawings.

(54) Title: **DOWNHOLE SENSING APPARATUS WITH SEPARABLE ELEMENTS**

(57) Abstract: A sensing apparatus (16) is provided for use downhole, comprising a housing (22) and sensing means (52, 54, 56, 58) with the housing (22) containing a plurality of separable elements (64) to which data acquired by the sensing means (52, 54, 56, 58) is transferred. The separable elements (64) are releasable from the housing to convey the acquired data to surface. The separable elements have a spherical outer casing (72) of around 1 to 10 cm diameter which surrounds a memory chip (74). The casing (72) has a sealable aperture (76) so that electrical connection to the chip (74) can be established within the housing.
